

MICHAL FLUDER

3D CHARACTER ARTIST • 3D PROP ARTIST

PROFILE

I am a versatile, passionate artist with a strong desire to learn and evolve in the creative field. Consistently motivated to refine their skillset further, learn from professionals, and to create art.

It's been a lifelong ambition to work as a 3D artist within the video-game industry, and to work on projects I am truly passionate about.

As a growing 3D artist, I utilise my spare time to develop my modelling skill-set across a variety of assets challenges and game jams. I have created game ready assets as well as stylised renders through texturing and scene composition, as seen in my portfolio.

Please, visit my website to see my portfolio!

KEY SKILLS

Organic Modelling

Hard Surface Modelling

Asset Optimisation

PBR & Stylised Texturing

Procedural Texturing

UV Mapping

Maya

ZBrush

Blender

Unity & Unreal Engines

Substance Painter & Designer

EXPERIENCE

2023
2022

Student | CG Spectrum - 3D Modeling Course

As a CG Spectrum student I had the opportunity to learn advanced modelling practices directly from industry experts, with experience in large commercial projects such as the Arcane series and Pacific rim.

Here I developed a deep understanding of foundational 3D modelling principles in industry standard tools. I learnt digital sculpting within Zbrush to create both high detail and stylised characters and environments, as well as high quality texturing with Substance Painter for photorealistic rendering. I also learnt high detail modelling and asset optimisation in Maya.

During this course I developed four high poly models across several modelling specialties; A soft body organic penguin, hard shell organic dragon, a hard surface prop pipe hammer, and a mixed surface prop sci-fi helmet. These models added a great deal of depth to my 3D modelling and texturing skillset, with each model focusing on a new design technique and principal, reinforced with hands on feedback from course leaders and industry experts.

Beyond this I have continued to develop my skills in organic digital sculpting by creating two additional stylised characters, Lidia and Ogre. These characters are fully rigged, optimised game-ready assets with hard surface armour. I have also created procedurally generated texturing for foliage assets, and customisable shaders within Substance Designer for diverse material controls.

Individual | 3D Modelling competitions

I have taken part in multiple Hum3D.com modelling competitions to test my design skills, self-manage to work to a brief, and to try exciting new design areas. "Without Borders" was an architectural render competition where I chose to model and texture a cultural landmark medieval crane from Gdansk, Poland. It was a fun challenge to try and recreate the structure as accurately as possible from reference imagery, as well as using texturing sampling techniques to create a realistic final render of the crane along the harbour side.

"Flying Cars" was an inter-city flying car render competition. Here I chose to model the British classic Peel P50 in the style of a DIY flying car conversion, following inspiration from Top Gear. This was a good exercise in hard surface modelling and PBR texturing to create a realistic render, but also a fun creative dive into how to best portray a believable, grounded, custom flying conversion to an iconic 1960s microcar - incorporating dampeners, turbines, and a welded roll cage.

2017

Volunteer 3D Artist | Echo Games CIC

Here I worked within the PLAI project team as part of UNREST, sponsored by Horizon 2020. As a team we developed an agnostic strategic multiplayer serious game 'Endless Blitz' for the 'Krieg.Macht.Sinn' exhibition in the Ruhr Museum in Essen, Germany. As the 3D Artist for the project, I designed and iterated on all low-poly 3D in Blender across a variety of modelling specialties; Props, such as planes, bombs and weapons -Organics, for all characters and foliage - Environments, for the lakes and mountains of the game world required to bring the World War 2 Operation Chastise to life.

This was a valuable experience in working within a larger project to a commercial deadline. I was able to refine my design iteration skills to keep the project visuals moving, as well as opening up feedback across the team to ensure the vision of the project is upheld.

Individual | Personal Projects

In my spare time I have worked on several personal projects including a 3D stealth game 'Maiko', a mobile serious game 'Paw Tracker' and a VR sandbox game 'The Creation'. I have created a diverse range of game ready 3D characters and props, ranging from low-poly and stylised assets to high-poly and photorealistic assets, all viewable on my website portfolio.
